Tag	Rationale from framework	Rationale within excerpt	Rationale beyond excerpt
Assessing computational models	Identify model, phenomena, and comparison.	Here the group is clearly articulating WHY they need to change the type of variable that represents the position of the satellite is -- because the force needs to have a direction like the position does. The group begins to re-define their net force in terms of the vector position of the satellite so that it picks up this vectorial nature.	The phenomenon is a central force.
